

# FLOODLIGHTS

## Patt 137 100/150/200 Watt

This small floodlight provides a wide angle evenly distributed beam.

For small scale stage lighting installations two or three of these units, on a single control circuit, are ideal for providing a low intensity wash of light over the acting area to consolidate the limited amount of spotlighting. For this purpose they are preferable to batten or borderlight as the adjustments for both swivel and tilt allows each unit to be directed individually.

Other applications include close range lighting of door and window backings and display backgrounds.

The Ref. 245 Masking Hood slides into the internal colour frame runners to provide a more directional unit to supplement the spotlighting. This accessory is particularly useful in a small multi-purpose hall where general illumination has to be provided for meetings but more directional lighting is required for dramatic performances.
